

**ABSTRACT OF THE DISCLOSURE**

1  
2 A computer system having a booting image storing device, which is capable of being  
3 composed of a hard disk drive, a memory, and a compact disk drive. An initial state of a main  
4 memory is converted to a boot image, and the boot image is stored to the boot image storing device,  
5 when the computer system is powered off. When the computer system is powered on, the booting  
6 image is read out from the boot image storing device without loading and referring respective drivers  
7 of hardware components whenever booting the system. The main memory can be supplied the power  
8 from an auxiliary power supply when a main power of the computer system is shut off.
